

Interdental/Electric Toothbrush headDual Motion Brush Head

Concept: Central Fiber(s) have axial motion rising above top plane of rotating tooth brush head acting as "pick" between tooth cavities:

Central "pk" fiber(s) achieves motion by cam action on order stationary housing. As main brush head rotates, central fiber(s) rise above top plane of brush, retract on back rotation.

Requires only minor redesign of current brush head to achieve mechanical motion from existing brush design.

To accommodate current drive mechanism

Cut away at some central core material

to fit drive pin. Also expand outer casing

of plastic head to fit "sleeves" of brush

Primary Brush Head Components

- A: Inter-Dental Probe
- B: Slider Core
- C: Cam Follower Pins
- D: Brush / Base
- E: Vertical Slider Track
- F: Cam Track
(Note: Cam can take on any useful shape:
 1. Sinusoidal
 2. Curved
 3. Linear
 4. etc...)
- G: Housing
- H: Guide / Rotation Pin
- I: Retaining Pin
- J: Retaining Track
